WATER POLLUTION CONTROL

COMPLIANCE ASSURANCE SECTION #19

2520 WEST ILES AVENUE

POST OFFICE BOX 19276

IL 532 2585

SPRINGFIELD, ILLINOIS 62794-9276

This Agency is authorized to require this information under Section 4 and Title X of the Environmental Protection Act (415 ILCS 5/4, 5/39). Failure to disclose this information may result in: a civil penalty of not to exceed \$50,000 for the violation and an additional civil penalty of not to exceed \$10,000 for each day during which the violation continues (415 ILCS 5/42) and may also prevent this form from being processed and could result in your application being denied. This form WPC 691 Rev 4/25 has been approved by the Forms Management Center.

South Beloit, Illinois

Attachments to IEPA Annual Report, NPDES Permit for Storm Water Discharge from MS4's (2020-2021) - Year #7

A. No changes to the best management practices at this time.

B. 1. Public Education and Outreach

- The City provided educational brochures for the public in hard copy form at City Hall. Examples of these brochures have been attached to this report.
- Site plans submitted to the City are reviewed by the City Engineer. The City informs developers about best management practices (BMP's) for site plans which are received during initial project kickoff meetings.
- The City did not hold a public meeting for MS4/SWMP review in 2020.

2. <u>Public Participation/Involvement</u>

- Storm Drain Marking The City of South Beloit Streets Department paints storm inlets annually to clearly demarcate that they drain to water ways.
 Records of inlet painting were not collected but the City will work to create a repoting log of storm drain maintenance for future reporting.
- The City has a medication drop off located at the police station. They average between 3 to 5 pounds of medication collected per month.
- The City encourages residents to volunteer for Keep Northern Illinois Beautiful *Great American Cleanup Day*. Community cleanup days are also sponsored and held annually by the Nature at the Confluence, focusing on environmental cleanup.
- The City established contact information on the website for the public to notify the agency about storm water related issues.

3. <u>Illicit Discharge Detection & Elimination</u>

- The City continues to complete updates to storm sewer maps as necessary and provides updates to WinGIS.
- The City checks for illegal dumping and illegal discharge during dry periods. No complaints of illicit discharges were received during the reporting period. Due to personnel changes, records of outfall inspections were not collected.
- The City's Ordinances are reviewed annually and are updated as needed.
- The City continues to operate their Illicit Discharge Detection & Elimination (IDDE) Plan. The plan has been successful and no updates were required during this reporting period.

4. Construction Site Runoff Control

- The City reviews the Erosion & Sediment Control Ordinance routinely.
- The City reviews site plans for appropriate erosion and sediment BMPs according to the City ordinance and requires an Erosion Control Inspection Log and other necessary paperwork onsite with NPDES permits for construction site operators.
- The City encourages green infrastructure in new developments when applicable.
- The City continues to update and revise procedures.

• The City works with developers and regional inspectors to ensure BMP's are being implemented.

5. Post-Construction Runoff Control

- City staff reviews the Storm Water Management Plan annually.
- City staff sweeps all streets within the City boundaries each spring, fall and summer, as necessary. The City did not keep logs of street sweepings, but has developed a street sweeping log for the next reporting period.
- City staff repaired/cleaned multiple inlets, but a log was not completed during this reporting period.
- City Engineer continues to review any new proposed development over one acre or a smaller than one acre parcel within a larger development to oversee and ensure compliance with MS4 BMP's and address any issues with compliance. A copy of a City development review is included with this report.
- City staff and City Engineer review site plans and conduct surprise site inspections, ensuring proper paperwork has been obtained for permits. The City also uses inspections completed by the Winnebago County Soil Conservation district to enforce compliance.

6. <u>Pollution Prevention/Good Housekeeping</u>

- City did not conduct annual training for City staff that was documented.
- The City adopted Winnebago County's Hazardous Waste Spill Response and Prevention Program as their ordinance. They use Winnebago County's HAZMAT team for emergency situations.
- The City Fire Department receives paperwork annually for businesses that handle large amounts of hazardous waste.
- The City keeps a large supply of oil dry for any spills on City roadways.
- The majority of City trucks have spill kits to contain small spills.
- C. No monitoring data collected at this time.
- D. The City will continue to enforce BMP's for site developments. The City will attempt to meet the measurable goals outlined in its permit. The City shall specifically review its sewer outfall inventory and update it as needed. The City will continue to review any site developments and assist the permit holders in complying with their NPDES permit requirements.
- **E.** The City works with the Winnebago County HAZMAT team during hazardous waste spills.

F. City Projects

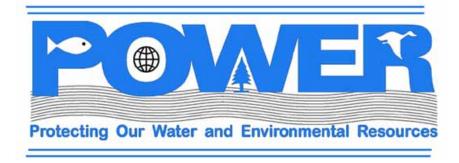

- 2020 MFT Street Maintenance Program
- 2020 City Hall Improvements
- 2020 Fire Department Parking Lot Improvements

PURDUE EXTENSION

Climate Change How will you manage stormwater runoff?

Robert McCormick, Planning with POWER Project Leader, Illinois-Indiana Sea Grant Leslie Dorworth, Aquatic Ecologist, Illinois-Indiana Sea Grant

Introduction

Most climate change scientists agree on one thing: we're going to see more frequent and intense storm and rainfall events along with increased flooding, stormwater runoff, and soil erosion. The increased runoff and flooding will force planners and stormwater specialists to develop strategies to deal with the increased volume and velocity of stormwater.

Some of these strategies may include:

- 1. Plan for more green infrastructure.
- 2. Use low impact development strategies to reduce stormwater.
- 3. Minimize impervious surfaces such as parking lots, roads, and rooftops.
- 4. Use smart growth and sustainable growth strategies that decrease road building and include transportation choices other than automobiles.
- 5. Encourage riparian buffers along streams, rivers, and waterways and maintain flood plains.
- 6. Protect and reestablish wetlands to hold runoff and recharge groundwater.
- 7. Encourage tree planting, especially in urban settings.
- 8. Promote landscaping with native vegetation to further reduce runoff and the need for irrigation.
- 9. Accelerate the move to separate, combined sewer overflows to reduce pollution from sewage, bacteria, and *E. coli* entering waters during storm events.
- 10. Coordinate planning of infrastructure, housing, and transportation under the new climate change regime.

Plan for More Green Infrastructure

The infrastructure that supports a community includes both the gray infrastructure we build (roads, buildings, sewer/water/electrical lines) and the green infrastructure or the natural environment (water, air, natural resources). When developing a plan for the future, think of green infrastructure as a network of interconnected natural areas and open space that provides critical functions such as groundwater recharge, pollution mitigation, reduced

runoff and erosion, and improved air quality for communities. Forests, wetlands, natural areas, riparian buffers, agricultural land, and flood plains are examples of green infrastructure. Communities may also need to develop strategies for upgrading infrastructure in already developed areas.

Use Low Impact Development Strategies

Traditional approaches to stormwater management include use of pipes, curbs, gutters, storm drains, and detention ponds. With more frequent and intense precipitation events, communities will need to use new strategies such as bioretention, vegetated swales, and porous/pervious/permeable paving alternatives to supplement traditional stormwater conveyance systems.

Minimize Impervious Surfaces

Two-thirds of our impervious surfaces today consist of roads, highways, and parking lots. We'll need new ordinances and building/construction design requirements to reduce imperviousness in the future. Many communities are revising parking lot requirements and designs for new buildings. Road construction is under increased scrutiny across the country as community planners ask for complete streets that include space for pedestrians, bicycles, and mass transit. Increasing our transportation choices reduces the need for more pavement.

Use Smart Growth and Sustainable Growth Strategies

Smart growth strategies direct development near existing infrastructure. By locating new houses near offices and entertainment in downtown and town centers, we reduce the need for new infrastructure (roads, streetlights, electric lines, sewers, waterlines, gas lines, etc.). This lowers greenhouse emissions and ultimately lessens the cost of services for all communities. Combining compact, mixeduse development with commercial, residential, and office space leads to reduced water consumption and runoff. At the same time, it reduces greenhouse gas emissions by reducing energy consumption.

Encourage Riparian Buffers and Maintain Flood Plains

Increased precipitation events will dictate how we mitigate runoff from flooded areas. Changes in climate will force us to maintain natural flood plains and to forbid construction and development in those flood plains. Under certain scenarios, flood plains may need to be expanded to encompass more land area that will accommodate the increased rainfall events. In addition, we'll need riparian buffers (vegetated areas) and filter strips along waterways to further slow runoff and filter non-point pollutants. Otherwise, we could face increased erosion and, with it, increased pollution of streams, rivers, and lakes.

Protect and Reestablish Wetlands

Wetlands could become increasingly important both in drier areas and in high-runoff areas under future climate change scenarios. They'll be highly valued, because they have great capacity to hold water, recharge groundwater, and mitigate water pollutant. Constructed wetlands, as well as natural wetlands, will be valued for these vital functions related to a community's water supply.

Encourage Tree Planting

We should plant more trees in our communities. Trees help us manage stormwater by reducing runoff and mitigating erosion along streams and waterways when they are part of riparian buffers. Other critical functions provided by trees include cooling the heat islands in urban areas and shading pedestrians as they travel on streets and roadways.

Promote Landscaping with Native Vegetation

Traditional landscaping includes high-maintenance turfgrass and other nonnative species that require vast amounts of water during dry periods. In addition, turfgrass and nonnative species require excess fertilizer and pesticide applications that contribute to nonpoint pollution and runoff. This further contaminates surface and groundwater resources of local communities. Communities should promote the use of native vegetation in landscaping.

Accelerate the Move to Separate, Combined Sewer Overflows

Increased frequency and intensity of storm events will result in more combined sewer overflows (CSOs) that release additional, untreated sewage into streams and rivers across the country. That sewage carries with it bacteria, particularly *E. coli*. CSOs are regulated and every community should have a mitigation control plan; however, the need to replace this outdated infrastructure with the new climate change forecasts is much more urgent now due to the increased potential for contamination.

Coordinate Planning of Infrastructure, Housing, and Transportation

Finally, coordination in planning becomes essential as the overall system faces increased stress. Land-use planning is closely linked to transportation planning, and both have tremendous effects on the environment and natural resources. We must use our critical resources efficiently as we face potential climate change that could cause scarcity, depletion, and diminished quality of water, land, and air for communities in the future. With planning we can prevent some of these problems.

Additional Resources

Chicago Wilderness

www.chicagowilderness.org

Chicago Wilderness is an alliance of federal, state, and local governments, environmental and non-governmental organizations, and institutions of higher learning working together to improve the quality of life and to protect natural resources for the citizens of the Chicago region. The group has developed the Climate Action Plan for Nature, which addresses biodiversity and climate change in the Chicago region.

Chicago Climate Action Plan www.chicagoclimateaction.org

The Chicago Climate Action Plan highlights the plans the city of Chicago proposes to take on relative to reducing the city's contribution to climate change.

NOAA Climate Services

www.climate.gov/#climateWatch

NOAA Climate Services site provides a national perspective on the impacts of climate change.

Intergovernmental Panel on Climate Change www.ipcc.ch

The Intergovernmental Panel on Climate Change is the leading body for the assessment of climate change, established by the United Nations Environment Program (UNEP) and the World Meteorological Organization (WMO) to provide the world with a clear scientific view on the current state of climate change and its potential environmental and socio-economic consequences.

The Midwestern Regional Climate Center

http://mcc.sws.uiuc.edu

The Midwestern Regional Climate Center at the University of Illinois serves the nine-state (Illinois, Indiana, Wisconsin, Michigan, Kentucky, Iowa, Missouri, Minnesota, and Ohio) Midwest region. The center is an excellent source for climate data and research.

Post Carbon Institute

www.postcarbon.org

Post Carbon Institute provides individuals, communities, businesses, and governments with the resources needed to understand and respond to the interrelated economic, energy, and environmental crises that define the 21st century.

Clean Water

Everybody's Business

10 Things You Can Do to Prevent Stormwater Runoff Pollution

- ♦ Use fertilizers sparingly and sweep up driveways, sidewalks, and gutters
- Never dump anything down storm drains or in streams
- Vegetate bare spots in your yard
- ▲ Compost your yard waste
- Use least toxic pesticides, follow labels, and learn how to prevent pest problems
- Direct downspouts away from paved surfaces; consider starting a rain garden
- Take your car to the car wash instead of washing it in the driveway
- Check your car for leaks and recycle your motor oil
- Pick up after your pet
- Have your septic tank pumped and system inspected regularly

FACT SHEET: Overview of Green Infrastructure

Examples of Green Infrastructure (GI) techniques, including several from Lancaster City

DESCRIPTION

What is Green Infrastructure? Green infrastructure (GI) refers to a decentralized network of site-specific stormwater management techniques (see below for examples). GI techniques are implemented to reduce the volume of stormwater runoff entering the sewer system while also restoring the natural hydrologic cycle. As opposed to gray infrastructure - the traditional network of costly large scale conveyance and treatment systems - green infrastructure manages stormwater through a variety of small, cost-effective landscape features located on-site.

Green infrastructure is particularly important in urban areas with combined sewers, where during wet weather events, combined sewer overflows (CSOs) result in untreated combined sewage being discharged directly into water bodies. (See diagram on page 2). These CSO events can significantly impact downstream water quality. As cities are increasingly required by legislation to reduce the frequency and volume of CSO events, greater emphasis is being placed on implementing alternative ways of managing urban stormwater runoff using GI techniques.

How does Green Infrastructure work? Green infrastructure employs the following processes to design a hydrologically functional site that mimics predevelopment conditions:

- Infiltration (allowing water to slowly sink into the soil)
- Evaporation/transpiration using native vegetation
- Rainwater capture and re-use (storing runoff to water plants, flush toilets, etc.)

Common Green Infrastructure Techniques

- Downspout Disconnection
- Cisterns/Rain Barrels
- Bioretention (Rain Gardens)
- Vegetated ("Green") Roofs
- Stormwater Planter Boxes
- Infiltration Practices (Basins, Trenches, Dry Wells)
- Pervious Pavement with Infiltration
- Green Streets/Green Alleys
- Vegetated Swales
- Tree Trenches
- Vegetated Curb Extensions

BENEFITS OF GREEN INFRASTRUCTURE

Environmental Benefits

- Recharges and improves quality of ground and surface waters
- Provides natural stormwater management
- Improves energy efficiency
- Reduces urban heat island effect
- Improves aquatic and wildlife habitat

Social Benefits

- Improves aesthetics and livability of urban communities
- Increases recreational opportunities
- Improves water and air quality
- Fosters environmental education opportunities

Economic Benefits

- Reduces existing and potential future costs of gray infrastructure
- Increases property values
- Reduces energy consumption costs

Image Source: artfulrainwaterdesign.net

GREEN INFRASTRUCTURE CAN REDUCE THE FREQUENCY AND VOLUME OF CSO EVENTS

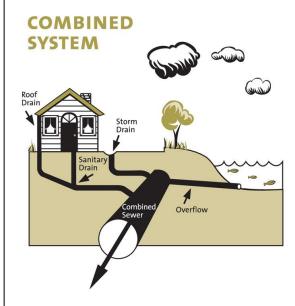

Diagram of combined sewer system

Source: EcoJustice.ca

ADDITIONAL CONSIDERATIONS

Maintenance of Green Infrastructure

Similar to conventional gray infrastructure, green infrastructure does require some level of maintenance to ensure optimal performance:

- Many GI techniques require regular maintenance, whether related to vegetation (weeding, pruning, mulching) or operational maintenance/repair (cleaning pervious pavement)
- The life cycle of the technology or vegetation used in the GI technique must be taken into account when preparing a maintenance plan

Cost of Green Infrastructure

- Costs for green infrastructure vary widely depending on specific site conditions and the type of GI techniques being used
- Often the cost of GI projects is competitive with or less than comparable gray infrastructure projects

RE: Prestige Storage Site Developments - City of South Beloit Site Development Permit Application Subject:

Date: Thursday, June 4, 2020 8:37:00 AM

image001.png Attachments:

image003.png

Nicholas,

Please see the comments below pertaining to the Prestige Storage site development permit submission as well as the Tentative/Final Plat submission that was received electronically earlier this week.

Engineering Comments on Site Development Package:

- 1. IEPA NPDES permit must be provided due to more than an acre of disturbance on the site.
- 2. Verify with IDOT whether or not an IDOT Drainage Permit should be obtained due to the fact that drainage is being released into IDOT right of way and existing drainage patterns will have been changed.
- 3. Fence details should be included in the plans and a separate permit applied for using the form posted on the City's website.
- 4. Show elevation contours on existing and demo sheets with contour labeling included.
- 5. Please verify that this project is no longer planned to be phased and it will instead enter a full buildout approach. If this site is to be phased, we will need to have plans to indicate how stormwater will be managed throughout the phased construction.
- 6. There is no emergency overflow weir on the eastern detention basin. This is required per South Beloit Code Section 34-86 3a.(8)
- 7. Please label the piping that is exiting the eastern detention basin to indicate invert elevations and pipe size on the plans.
- 8. Please update the pavement section and v-gutter details to reference IDOT standards rather than Wisconsin standards.
- 9. Please update the stormwater management plan to include rainfall data from the current ISWS Bulletin 70 document. This rainfall information doesn't appear to reflect the March 2019 Bulletin 70 rainfall distributions.
- 10. Please provide infiltration rate justification in geotechnical report from TSC as referenced. This is necessary to prove that both basins will operate as designed.
- 11. Please indicate where the existing septic field is located on the plans to be sure that the development doesn't encroach. It should be noted that should the existing septic field fail in the future, there is existing sanitary sewer on the west side of Willowbrook Road that the property owner would be required to extend and connect into per City Code and Winnebago County Health Department requirements.

Zoning Department Comments on Site Development Package:

- 1. Please indicate the proposed use for the existing building so that parking counts can be properly verified.
- 2. Please include proposed landscaping on the plans in conformance with the SUP requirements.
- 3. Indicate where the dumpster enclosure will be placed.

Preliminary and Final Plat Comments:

1. Please add a note to the final plat stating "There shall be no direct vehicular access to or from

Lot 1 to the Illinois State Toll Highway I-90".

2. Include drainage and stormwater detention easements as necessary based on the proposed plan.

Please let me know if you have any questions.

Thanks,

SETH GRONEWOLD, PE | Project Manager Fehr Graham | Engineering & Environmental
